

request mic permissions by ppm

when entering AISoundControlMaster app, **permission access notification alarm should be presented** (allowing microphone is optional to user this time. Since there is an area in the app that does not use the microphone)

but **microphone permission should be allowed before actual microphone opening.**

so, whenever AISoundControlMaster app calls openMicrophone() api, AISoundControlMaster should check microphone permission.

if permission is allowed, just call openMicrophone()

if permission is not allowed, app must present notification alarm for allowing microphone

- if user block microphone permission, app cannot open microphone. (It would be good to notify people that the microphone cannot be opened via a toast alarm)
- if user allow microphone permission, app opens microphone.

microphone permission should be requested when **entering the app** and **before actual mic open.**

after asking below luna api(`com.webos.service.ppm/requestPermission`), you can check AISoundControlMaster's microphone permission on **settings>Support>Privacy & Terms>App Permissions>Microphone>AISoundControlMaster**

1. entering AISoundControlMaster app

app should request permission by calling below api, but allowing microphone permission is optional

```
luna-send -n 1 -f luna://com.webos.service.ppm/requestPermission '{"appId" : "<AI Sound Control Master app's Id>", "uri" : "luna://com.webos.service.microphone/requestMicrophonePermission", "rational":"App wants to call mic API", "forceAsk":true}'
```

return value is like below

```
// click Block
{
  "status": "deny",
  "returnValue": true
}

// click Allow
{
  "status": "allow",
  "returnValue": true
}
```

When a luna call is invoked, ppm **present notification alarm** and **does not return immediately** but **waits for user selection**.

after user allow mic permission, requestPermission luna call returns immediately ("status": "allow") and doesn't present notification alarm.

if user deny mic permission, entering the app should be possible.

2. before actual mic open

app must request or checking microphone permission every time before calling openMicrophone api.

```
luna-send -n 1 -f luna://com.webos.service.ppm/requestPermission '{"appId" : "<AI Sound Control Master app's
Id>", "uri" : "luna://com.webos.service.microphone/requestMicrophonePermission", "rational":"App wants to call
mic API", "forceAsk":true}'
```

and return value is like below

```
// click Block
{
  "status": "deny",
  "returnValue": true
}

// click Allow
{
  "status": "allow",
  "returnValue": true
}
```

When a luna call is invoked, ppm present notification alarm and does not return immediately but waits for user selection.

after user allow mic permission, requestPermission luna call returns immediately ("status": "allow") and doesn't present notification alarm.

when user deny mic permission, then app must not open microphone. and wait.
